Sequence 220, Application US/09215681A

Patent No. 652823

GENERAL INFORMATION:

APPLICANT: Mitcham, Jennifer L.

APPLICANT: Frudakis, Tony N.

APPLICANT: Frudakis, Tony N.

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR DIAGNOSIS

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR DIAGNOSIS

TITLE OF INVENTION: OF OVARIAN CANCER

FILE REFERENCE: 210121.463

CURRENT APPLICATION NUMBER: US/09/215,681A

CURRENT FILING DATE: 1998-12-17

NUMBER OF SEQ ID NOS: 310

SOFTWARE: PSESSEQ for Windows Version 3.0

SEQ ID NO 220

LENGTH: 928
APPLICANT: Mitcham, Jennifer Lynn

The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (FG) activation, and fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or independently and also characteristically to bind with fibrin independently and also characteristically retains a FG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in

ABR58278-ABR58323 and ABR58346-ABR58362 represent polypeptides encoded by polynucleotides of the invention that are differentially-regulated in becast cancer. NOTE: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

ö
              hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of plasminogen in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus aiding in the localisation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use
                                                                                                                                                                                                                                                                                                                                                                                                                           9

WPI; 2003-381623/36. N-PSDB; ACC72037. New isolated human differentially-regulated breast cancer polynucleotide and polypeptide, useful for diagnosing, staging, prognosticating, preventing and/or treating diseases and conditions relating to breast

Claim 6; SEQ ID NO 52; 127pp + Sequence Listing; English

differentially-regulated in breast cancer. The methods and compositions of the present invention are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing and/or treating diseases and conditions relating to breast concer, and may be used in gene therapy or antisense therapy. They can also be used in research, drug discovery, clinical medicine and forensic medicine. Sequences given in records The invention relates to isolated polynucleotides which are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Proteins with cell migration stimulatory activity used in treating wound and preventing scarring.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides a human migration stimulatory factor (MSF) protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence represents the human MSF1-alpha protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     258
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                     Proteins with cell migration stimulatory activity used in treating wound
                                                                                                                                                                                                                                                                                                                                                                                 The invention provides a human migration stimulatory factor (MSF) protein. Host cells containing a replicable vector comprising the MSF encoding nucleic acid can be used for the recombinant production of the protein. The polypeptide can be used for modulating cell migration, healing a wound and for preventing scarring. The present sequence

This invention relates to a novel protein (and the gene which encodes it) which has a matrix binding region which assembles to a cell surface, or extracellular matrix surrounding the cell, and a leukaemia inhibitory factor region which suppresses cell differentiation of embryonic stem cells. The invention is useful for suppressing cell differentiation. The invention is useful for suppressing cell differentiation. The protection thus enables efficient and continuous proliferentiation of embryonic stem cells. Therefore, embryonic stem cells can be prepared in large quantities and untilsed for fundamental research and applications. The present sequence is that of the human mini-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel protein which has matrix binding region which assembles to cell surface, or to extracellular matrix surrounding cell and leukemia inhibitory factor region that suppresses cell differentiation of embryonic stem cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 PIAEKCFDHAAGTSYVVGETWEKPYQGWMMVDCTCLGEGSGRITCTSRNRCNDQDTRTSY

The invention relates to an isolated polypeptide comprising one of 127 sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature of Corm of NOVX, an amino acid sequence which is at least 95t identical to NOVX or an amino acid sequence comprising one or more conservative convertive in NOVX and an antibody one or more conservative conservative substitutions in NOVX. Also included are nucleic acids encoding NOVX or CONVX or NOVX DIA in a presence or amount of NOVX or NOVX DIA in a cimmunospecifically to the polypeptide, and determining the presence or immunospecifically to the polypeptide, and determining the presence of amount of antibody bound to the polypeptide, determining the presence of corpredisposition to a disease associated with altered levels of expression of NOVX DIA in a first mammalian subject, identifying an agent that binds to NOVX, identifying a potential therapeutic agent corpression of NOVX identifying a potential therapeutic agent of treatment of a pathology related to aberrant expression or aberrant corporations of NOVX, and not an anti-NOVX antibody. The NOVX more of or of latency or predisposition to a pathology associated with NOVX, or useful as marker for cell or tissue type, and in diagnosing and treating pathologies, diseases, conditions or disorders associated with NOVX sequences, including crackiomyopathy, atherosclerosis, hypertension, congenital heart defects, prostate cancer, diabetes metabolic disorders.

Congenital heart defects, prostate cancer, diabetes, metabolic disorders, neoplasm, graft versus host diseases, AlbS, bronchial asthma, Canhors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Malyankar UM, Burgess CE, Gerlach VL, Casman SJ, Rieger DK, Grosse WM, Smithson G, Peyman JA, Starling G, Rothenberg ME, Larochelle WJ, Shimkets RA, Crabtee J, Rastelli L, VOSS EZ, Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K,

                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel protein (and the gene which encodes it) which has a matrix binding region which assembles to a cell surface, or extracellular matrix surrounding the cell, and a leukaemia inhibitory factor region which suppresses cell differentiation of embryonic stem cells. The invention is useful for suppressing cell differentiation. The invention can be used for the efficient inhibition of embryonic stem cell differentiation. The invention thus enables efficient and continuous proliferation of embryonic stem cells can be prepared in large quantities and utilised for fundamental research and applications. The present sequence is that of the protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    209

The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lession in a novel pene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, ancexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's disease, immune disorders and haematopoletic disorders. This sequence represents a human NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ; Anderson DW, Vernet CAM, Catterton E, Miller CE, Shenoy SG; Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyanar UM, Burgess CE, Gerlach V, Casman SJ, Rieger DK; Grosse WM, Sithson G, Peyman JA, Starling G, Rothenberg ME; Larochelle WJ, Shimkets RA, Crabtree J, Rastelli L, Voss EZ; Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as

                                                                                                                                                        8
```

Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic the lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

The present sequence is that of the human extracellular matrix
glycoprotein, fibronectin. An integrin binding site comprising the
glycoprotein, fibronectin. An integrin binding site comprising the
fibronectin type III repeat domains 8-11 can be used as a selective
binding domain in selective tissue vascular thrombogens (STVTS) of the
invention, conferring coagulative properties on the surface of cells that
are otherwise inactive. The STVTS can induce targeted thrombosis,
cinfarction and destruction of selected tissues. They have at least 2
functional domains: a tissue factor polypeptide that induces
thrombogenesis, and a selective binding domain that can bind to a cell-
specific or tissue-specific molecule, e.g. to a molecule within a tumour,
such as a molecule on the luminal surface of a tumour blood channel. Upon
cut and the tissue factor polypeptide induces thrombosis. The STVTs can
bind to channels within any tissue, including a solid tumour. First the tumour is

A CARLON

The invention relates to selective tissue vascular thrombogen (STVT) protein comprising a selective binding domain associated with a tissue factor (TF) polypeptide, where the selective binding domain can bind to a channel for blood within a tissue and the human tissue factor can initiate thrombosis within the channel. STVT is useful for treating a solid tumour in an animal. Pharmaceutical preparation comprising STVT is useful for the manufacture of a medicament for treating solid tumour such as lung, breast, ovary, seconach, pancreas, larynx, oesophagus, testes, liver, parotid, biliary tract, colon, rectum, cervix, uterus,

The invention relates to an isolated polypeptide comprising one of 127 sequences (appearing as ABO1288-ABO1414). designated as NOVX, a mature CC form of NOVX, an amino acid sequence which is at least 95% identical to NOVX or an amino acid sequence comprising one or more conservative cubstitutions in NOVX. Also included are nucleic acids encoding NOVX or NOVX but introducing the presence or amount of NOVX or NOVX DNA in a cample to an antibody that binds in munospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, determining the presence of cor predisposition to a disease associated with altered levels of expression of NOVX DNA in a first mammalian subject, identifying an agent that binds to NOVX DNA, are already appearant expression or aberrant for corrector comprising networks of NOVX, screening for a modulator of activity of or of latency or predisposition to a pathology associated with NOVX, a vector comprising networks diseases, conditions or disorders associated with NOVX, are useful as a marker for cell or tissue type, and in diagnosing and creating pathologies, diseases, conditions or disorders associated with NOVX sequences, including cardiomyopathy, atheroselerosis, hypertension, congenital heart defects, prostate cancer, disbetes, metabolic disorders, congenital heart defects, prostate cancer, disbetes, metabolic disorders, disease, multiple sclerosis, infectious disorders, desented cachexia, neurodegenerative disorders, desented cachexia, neurodegenerative disorders, desented cachexia, neurodegenerative disorders, desented or parkinson's disease, and wasting disorders associated with chronic diseases. These may also be used to screen for molecules which inhibit or money and in the park of the profession and por decent for molecules which inhibit or money. The profession and por decent for molecules with chronic diseases. These may also be used to screen for molecules a

Human fibronectin (AAR92778) has a fibrin-binding site, close to the Cterminus (amino acids 2123-2232 or 2141-2230), covering the 10F1.11F1 module pair of the protein. Fibrin-binding sites can be prepd. by enzymatic cleavage of fibronectin, peptide synthesis or by recombinant DNA techniques. They are used to detect a fibrin-binding target site, to treat disorders involving abnormal fibrinolysis or fibrinogenesis, to disrupt blood clots and to aid delivery of medicaments to fibrin- contg. sites. They show high affinity to and slow dissociation from fibrin, and provide fast diffusion and rapid clearance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to obtaining a population of quiescent haematopoietic cells (HC), comprising culturing HC while adhering the cells to a polypeptide having a very late antigen-4 (VLA-4) binding site,
                                                                        New fibrin-binding peptide molecules - used for the diagnosis and treatment of conditions associated with fibrin deposition, e.g. thrombi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for

ö

in particular fibronectin polypeptide, so as to expand the number of HC, where the adhering provides an increased percentage of quiescent HC. Also included are inducing apoptosis of a subpopulation of HC, by contacting the cells with a polypeptide having a VLA-4 binding site under conditions to cause apoptosis of a subpopulation of HC and a medium for culturing HC which enriches quiescent HC, comprising a fibronectin polypeptide. The method is useful for obtaining a cell population containing quiescent haematopoietic cells which are useful for treating a subject. Use of the Subsequencin of CD34+ HC population. The present sequence is human fibronectin which contains then VLA-4 binding site used in the method of the invention 88888888888888888888

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analygis of the total score distribution.
